Chapter 1

README

This document provides an overview of the project and instructions for running the 3D figure generator and viewer.

1.0.1 Table of Contents

1. Project Overview
 2. Running Instructions
 3. Program Features
 4. Demo
-

1.0.2 Project Overview

This part 1 of the project consists of two main components:

1. **Generator:** A command-line tool to generate 3D primitive shapes (plane, box, cone, sphere) and save them in `.3d` files.
 2. **Engine:** A 3D rendering engine that reads `.3d` files and renders them using OpenGL.
-

1.0.3 Running Instructions

To run the program, follow these simple steps:

1. Make the script executable:

```
chmod +x run.sh
```
2. Run the script:

```
./run.sh
```

1.0.4 Program Features

The generator program creates 3D primitive shapes and saves them in `.3d` files. Program Features The interactive menu provides the following options:

1. **Clean and Build**
 - Cleans the build directory
 - Rebuilds both generator and engine
 1. **Generate Figure**
-

- Plane (parameters: unit size, slices)
- Box (parameters: unit size, slices)
- Sphere (parameters: radius, slices, stacks)
- Cone (parameters: radius, height, slices, stacks)

All generated figures are automatically saved in tests

1. **View Figure**

- Lists all available generated figures
- Renders selected figure using OpenGL
- Config files are stored in configs

1. **Exit**

- Exits the program

Notes:

- Generated .3d files are saved in the tests directory
- XML configuration files are stored in configs folder
- Creating a new figure will override any existing file with the same name

1.0.4.1 **TODO**

- ☒ Fix some bugs
- ☐ Clean up the code
- ☒ Fix the box shape
- ☐ Document the rest of the code

1.0.4.2 **Demo**

7.12.1 Detailed Description

An attribute is a name-value pair. Elements have an arbitrary number of attributes, each with a unique name.

Note

The attributes are not XMLNodes. You may only query the [Next\(\)](#) attribute in a list.

Definition at line 1142 of file [tinyxml2.h](#).

7.12.2 Member Function Documentation

7.12.2.1 BoolValue()

```
bool tinyxml2::XMLAttribute::BoolValue () const [inline]
```

Query as a boolean. See [IntValue\(\)](#)

Definition at line 1189 of file [tinyxml2.h](#).

7.12.2.2 DoubleValue()

```
double tinyxml2::XMLAttribute::DoubleValue () const [inline]
```

Query as a double. See [IntValue\(\)](#)

Definition at line 1195 of file [tinyxml2.h](#).

7.12.2.3 FloatValue()

```
float tinyxml2::XMLAttribute::FloatValue () const [inline]
```

Query as a float. See [IntValue\(\)](#)

Definition at line 1201 of file [tinyxml2.h](#).

7.12.2.4 GetLineNum()

```
int tinyxml2::XMLAttribute::GetLineNum () const [inline]
```

Gets the line number the attribute is in, if the document was parsed from a file.

Definition at line 1153 of file [tinyxml2.h](#).

7.12.2.5 Int64Value()

```
int64_t tinyxml2::XMLAttribute::Int64Value () const [inline]
```

Definition at line 1170 of file [tinyxml2.h](#).

7.12.2.6 IntValue()

```
int tinyxml2::XMLAttribute::IntValue () const [inline]
```

IntValue interprets the attribute as an integer, and returns the value. If the value isn't an integer, 0 will be returned. There is no error checking; use [QueryIntValue\(\)](#) if you need error checking.
Definition at line 1164 of file [tinyxml2.h](#).

7.12.2.7 Name()

```
const char * tinyxml2::XMLAttribute::Name () const
```

The name of the attribute.
Definition at line 1432 of file [tinyxml2.cpp](#).

7.12.2.8 Next()

```
const XMLAttribute * tinyxml2::XMLAttribute::Next () const [inline]
```

The next attribute in the list.
Definition at line 1156 of file [tinyxml2.h](#).

7.12.2.9 QueryBoolValue()

```
XMLError tinyxml2::XMLAttribute::QueryBoolValue (
    bool * value) const

```
XMLError tinyxml2::XMLAttribute::QueryFloatValue (
    float * value) const
```

See [QueryIntValue](#).
Definition at line 1521 of file [tinyxml2.cpp](#).

7.12.2.12 QueryInt64Value()

```
XMLError tinyxml2::XMLAttribute::QueryInt64Value (
    int64_t * value) const
```

See [QueryIntValue](#).
Definition at line 1494 of file [tinyxml2.cpp](#).

7.12.2.13 QueryIntValue()

```
XMLError tinyxml2::XMLAttribute::QueryIntValue (
    int * value) const
```

QueryIntValue interprets the attribute as an integer, and returns the value in the provided parameter. The function will return XML_SUCCESS on success, and XML_WRONG_ATTRIBUTE_TYPE if the conversion is not successful.
Definition at line 1476 of file [tinyxml2.cpp](#).

7.12.2.14 QueryUnsigned64Value()

```
XML_Error_tinyxml2::XMLAttribute::QueryUnsigned64Value (

7.13.3 Member Function Documentation

7.13.3.1 Accept()

```
bool tinyxml2::XMLComment::Accept (
    XMLVisitor * visitor) const [override], [virtual]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implements [tinyxml2::XMLNode](#).

Definition at line 1327 of file [tinyxml2.cpp](#).

7.13.3.2 ParseDeep()

```
char * tinyxml2::XMLComment::ParseDeep (
    char * p,
    StrPair * parentEndTag,
    int * curLineNumPtr) [override], [protected], [virtual]
```

Reimplemented from [tinyxml2::XMLNode](#).

Definition at line 1298 of file [tinyxml2.cpp](#).

7.13.3.3 ShallowClone()

```
XMLNode * tinyxml2::XMLComment::ShallowClone (
    XMLDocument * document) const [override], [virtual]
```

Make a copy of this node, but not its children. You may pass in a Document pointer that will be the owner of the new Node. If the 'document' is null, then the node returned will be allocated from the current Document. (this->[GetDocument\(\)](#))

Note: if called on a [XMLDocument](#), this will return null.

Implements [tinyxml2::XMLNode](#).

Definition at line 1309 of file [tinyxml2.cpp](#).

7.13.3.4 ShallowEqual()

```
bool tinyxml2::XMLComment::ShallowEqual (
    const XMLNode * compare) const [override], [virtual]
```

Test if 2 nodes are the same, but don't test children. The 2 nodes do not need to be in the same Document.

Note: if called on a [XMLDocument](#), this will return false.

Implements [tinyxml2::XMLNode](#).

Definition at line 1319 of file [tinyxml2.cpp](#).

7.13.3.5 ToComment() [1/2]

```
virtual const XMLComment * tinyxml2::XMLComment::ToComment () const [inline], [override],
[virtual]
```

Reimplemented from [tinyxml2::XMLNode](#).

7.13.3.6 ToComment() [2/2]

```
virtual XMLComment * tinyxml2::XMLComment::ToComment () [inline], [override], [virtual]

7.15.1 Detailed Description

In correct XML the declaration is the first entry in the file.

```
<?xml version="1.0" standalone="yes"?>
```

TinyXML-2 will happily read or write files without a declaration, however. The text of the declaration isn't interpreted. It is parsed and written as a string. Definition at line 1072 of file [tinyxml2.h](#).

7.15.3 Member Function Documentation

7.15.3.1 Accept()

```
bool tinyxml2::XMLDeclaration::Accept (
    XMLVisitor * visitor) const [override], [virtual]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implements [tinyxml2::XMLNode](#).

Definition at line 1377 of file [tinyxml2.cpp](#).

7.15.3.2 ParseDeep()

```
char * tinyxml2::XMLDeclaration::ParseDeep (
    char * p,
    StrPair * parentEndTag,
    int * curLineNumPtr) [override], [protected], [virtual]
```

Reimplemented from [tinyxml2::XMLNode](#).

Definition at line 1347 of file [tinyxml2.cpp](#).

7.15.3.3 ShallowClone()

```
XMLNode * tinyxml2::XMLDeclaration::ShallowClone (
    XMLDocument * document) const [override], [virtual]
```

Make a copy of this node, but not its children. You may pass in a Document pointer that will be the owner of the new Node. If the 'document' is null, then the node returned will be allocated from the current Document. (this->[GetDocument\(\)](#))

Note: if called on a [XMLDocument](#), this will return null.

Implements [tinyxml2::XMLNode](#).

Definition at line 1358 of file [tinyxml2.cpp](#).

7.15.3.4 ShallowEqual()

```
bool tinyxml2::XMLDeclaration::ShallowEqual (
    const XMLNode * compare) const [override], [virtual]
```

Test if 2 nodes are the same, but don't test children. The 2 nodes do not need to be in the same Document.

Note: if called on a [XMLDocument](#), this will return false.

Implements [tinyxml2::XMLNode](#).

Definition at line 1368 of file [tinyxml2.cpp](#).

7.15.3.5 ToDeclaration() [1/2]

```
virtual const XMLDeclaration * tinyxml2::XMLDeclaration::ToDeclaration () const [inline],

7.16.1 Detailed Description

A Document binds together all the functionality. It can be saved, loaded, and printed to the screen. All Nodes are connected and allocated to a Document. If the Document is deleted, all its Nodes are also deleted.

7.16.3 Member Function Documentation

7.16.3.1 Accept()

```
bool tinyxml2::XMLDocument::Accept (
    XMLVisitor * visitor) const [override], [virtual]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implements [tinyxml2::XMLNode](#).

Definition at line 782 of file [tinyxml2.cpp](#).

7.16.3.2 Clear()

```
void tinyxml2::XMLDocument::Clear ()
```

Clear the document, resetting it to the initial state.

Definition at line 2224 of file [tinyxml2.cpp](#).

7.16.3.3 ClearError()

```
void tinyxml2::XMLDocument::ClearError ()
```

Clears the error flags.

Definition at line 2490 of file [tinyxml2.cpp](#).

7.16.3.4 DeepCopy()

```
void tinyxml2::XMLDocument::DeepCopy (
    XMLDocument * target) const
```

Copies this document to a target document. The target will be completely cleared before the copy. If you want to copy a sub-tree, see [XMLNode::DeepClone\(\)](#).

NOTE: that the 'target' must be non-null.

Definition at line 2258 of file [tinyxml2.cpp](#).

7.16.3.5 DeleteNode()

```
void tinyxml2::XMLDocument::DeleteNode (
    XMLNode * node)
```

Delete a node associated with this document. It will be unlinked from the DOM.

Definition at line 2326 of file [tinyxml2.cpp](#).

7.16.3.6 Error()

```
bool tinyxml2::XMLDocument::Error () const [inline]
```

Return true if there was an error parsing the document.

Definition at line 1884 of file [tinyxml2.h](#).

7.16.3.7 ErrorID()

```
XMLError tinyxml2::XMLDocument::ErrorID () const [inline]
```

Return the errorID.

Definition at line 1888 of file [tinyxml2.h](#).

const char * tinyxml2::XMLDocument::ErrorIDToName (
    XMLError errorID) [static]
```

Definition at line 2526 of file [tinyxml2.cpp](#).

7.16.3.9 ErrorLineNum()

```
int tinyxml2::XMLDocument::ErrorLineNum () const [inline]
```

Return the line where the error occurred, or zero if unknown.

Definition at line 1903 of file [tinyxml2.h](#).

7.16.3.10 ErrorName()

```
const char * tinyxml2::XMLDocument::ErrorName () const
```

Definition at line 2545 of file [tinyxml2.cpp](#).

7.16.3.11 ErrorStr()

```
const char * tinyxml2::XMLDocument::ErrorStr () const
```

Returns a "long form" error description. A hopefully helpful diagnostic with location, line number, and/or additional info.

Definition at line 2534 of file [tinyxml2.cpp](#).

7.16.3.12 HasBOM()

```
bool tinyxml2::XMLDocument::HasBOM () const [inline]
```

Returns true if this document has a leading Byte Order Mark of UTF8.

Definition at line 1801 of file [tinyxml2.h](#).

7.16.3.13 Identify()

```
char * tinyxml2::XMLDocument::Identify (  
    char * p,  
    XMLNode ** node,  
    bool first)
```

Definition at line 702 of file [tinyxml2.cpp](#).

7.16.3.14 LoadFile() [1/2]

```
XMLError tinyxml2::XMLDocument::LoadFile (  
    const char * filename)
```

Load an XML file from disk. Returns XML_SUCCESS (0) on success, or an errorID.

Definition at line 2344 of file [tinyxml2.cpp](#).

7.16.3.15 LoadFile() [2/2]

```
XMLError tinyxml2::XMLDocument::LoadFile (  
    FILE * fp)
```

Load an XML file from disk. You are responsible for providing and closing the FILE*.

NOTE: The file should be opened as binary ("rb") not text in order for TinyXML-2 to correctly do newline normalization.

Returns XML_SUCCESS (0) on success, or an errorID.

Definition at line 2363 of file [tinyxml2.cpp](#).

7.16.3.16 MarkInUse()

```
void tinyxml2::XMLDocument::MarkInUse (  
    const XMLNode * const node)
```

Definition at line 2211 of file [tinyxml2.cpp](#).

7.16.3.17 NewComment()

```
XMLComment * tinyxml2::XMLDocument::NewComment (  
    const char * comment)
```

Create a new Comment associated with this Document. The memory for the Comment is managed by the Document.

Definition at line 2279 of file [tinyxml2.cpp](#).

7.16.3.18 NewDeclaration()

```
XMLDeclaration * tinyxml2::XMLDocument::NewDeclaration (
    const char * text = 0)
```

Create a new Declaration associated with this Document. The memory for the object is managed by the Document. If the 'text' param is null, the standard declaration is used.:

```
<?xml version="1.0" encoding="UTF-8"?>
```

Definition at line 2295 of file [tinyxml2.cpp](#).

7.16.3.19 NewElement()

```
XMLElement * tinyxml2::XMLDocument::NewElement (
    const char * name)
```

Create a new Element associated with this Document. The memory for the Element is managed by the Document.

Definition at line 2271 of file [tinyxml2.cpp](#).

7.16.3.20 NewText()

```
XMLText * tinyxml2::XMLDocument::NewText (
    const char * text)
```

Create a new Text associated with this Document. The memory for the Text is managed by the Document.

Definition at line 2287 of file [tinyxml2.cpp](#).

7.16.3.21 NewUnknown()

```
XMLUnknown * tinyxml2::XMLDocument::NewUnknown (
    const char * text)
```

Create a new Unknown associated with this Document. The memory for the object is managed by the Document.

Definition at line 2303 of file [tinyxml2.cpp](#).

7.16.3.22 Parse()

```
XMLError tinyxml2::XMLDocument::Parse (
    const char * xml,
    size_t nBytes = static_cast<size_t>(-1))
```

Parse an XML file from a character string. Returns XML_SUCCESS (0) on success, or an errorID.

You may optionally pass in the 'nBytes', which is the number of bytes which will be parsed. If not specified, TinyXML-2 will assume 'xml' points to a null terminated string.

Definition at line 2447 of file [tinyxml2.cpp](#).

7.16.3.23 Print()

```
void tinyxml2::XMLDocument::Print (
    XMLPrinter * streamer = 0) const
```

Print the Document. If the Printer is not provided, it will print to stdout. If you provide Printer, this can print to a file:

```
XMLPrinter printer( fp );
doc.Print( &printer );
```

Or you can use a printer to print to memory:

```
XMLPrinter printer;
doc.Print( &printer );
// printer.CStr() has a const char* to the XML
```

Definition at line 2478 of file [tinyxml2.cpp](#).

7.16.3.24 PrintError()

```
void tinyxml2::XMLDocument::PrintError () const
```

A (trivial) utility function that prints the [ErrorStr\(\)](#) to stdout.

Definition at line 2540 of file [tinyxml2.cpp](#).

7.16.3.28 SaveFile() [1/2]

`XMLError tinyxml2::XMLDocument::SaveFile (`
 `const char * filename,`
 `bool compact = false)`

Save the XML file to disk. Returns XML_SUCCESS (0) on success, or an errorID.
 Definition at line 2417 of file [tinyxml2.cpp](#).

7.16.3.29 SaveFile() [2/2]

`XMLError tinyxml2::XMLDocument::SaveFile (`
 `FILE * fp,`
 `bool compact = false)`

Save the XML file to disk. You are responsible for providing and closing the FILE*.
 Returns XML_SUCCESS (0) on success, or an errorID.
 Definition at line 2436 of file [tinyxml2.cpp](#).

7.16.3.30 SetBOM()

`void tinyxml2::XMLDocument::SetBOM (`
 `bool useBOM) [inline]`

Sets whether to write the BOM when writing the file.
 Definition at line 1806 of file [tinyxml2.h](#).

7.16.3.31 ShallowClone()

`virtual XMLNode * tinyxml2::XMLDocument::ShallowClone (`
 `XMLDocument * document) const [inline], [override], [virtual]`

Make a copy of this node, but not its children. You may pass in a Document pointer that will be the owner of the new Node. If the 'document' is null, then the node returned will be allocated from the current Document. (this->[GetDocument\(\)](#))

Note: if called on a [XMLDocument](#), this will return null.

7.17.1 Detailed Description

The element is a container class. It has a value, the element name, and can contain other elements, text, comments, and unknowns. Elements also contain an arbitrary number of attributes.

7.17.3 Member Function Documentation

7.17.3.1 Accept()

```
bool tinyxml2::XMLElement::Accept (  
    XMLVisitor * visitor) const \[override\], \[virtual\]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;  
tinyxmlDoc.Accept( &printer );  
const char* xmlcstr = printer.CStr();
```

Implements [tinyxml2::XMLNode](#).

Definition at line 2143 of file [tinyxml2.cpp](#).

7.17.3.2 Attribute()

```
const char * tinyxml2::XMLElement::Attribute (
    const char * name,
    const char * value = 0) const
```

Given an attribute name, [Attribute\(\)](#) returns the value for the attribute of that name, or null if none exists. For example:

```
const char* value = ele->Attribute( "foo" );
```

The 'value' parameter is normally null. However, if specified, the attribute will only be returned if the 'name' and 'value' match. This allow you to write code:

```
if ( ele->Attribute( "foo", "bar" ) ) callFooIsBar();
```

rather than:

```
if ( ele->Attribute( "foo" ) ) {
    if ( strcmp( ele->Attribute( "foo" ), "bar" ) == 0 ) callFooIsBar();
}
```

Definition at line 1904 of file [tinyxml2.cpp](#).

7.17.3.13 GetText()

```
const char * tinyxml2::XMLElement::GetText () const
```

Convenience function for easy access to the text inside an element. Although easy and concise, [GetText\(\)](#) is limited compared to getting the [XMLText](#) child and accessing it directly.

If the first child of 'this' is a [XMLText](#), the [GetText\(\)](#) returns the character string of the Text node, else null is returned. This is a convenient method for getting the text of simple contained text:

```
<foo>This is text</foo>
const char* str = fooElement->GetText();
```

'str' will be a pointer to "This is text".

Note that this function can be misleading. If the element foo was created from this XML:

```
<foo><b>This is text</b></foo>
```

then the value of str would be null. The first child node isn't a text node, it is another element. From this XML:

```
<foo>This is <b>text</b></foo>
```

[GetText\(\)](#) will return "This is ".

7.17.3.14 InsertNewChildElement()

```
XMLElement * tinyxml2::XMLElement::InsertNewChildElement (
    const char * name)
```

Convenience method to create a new [XMLElement](#) and add it as last (right) child of this node. Returns the created and inserted element.

Definition at line 2039 of file [tinyxml2.cpp](#).

7.17.3.21 IntAttribute()

```
int tinyxml2::XMLElement::IntAttribute (
    const char * name,
    int defaultValue = 0) const
```

Given an attribute name, [IntAttribute\(\)](#) returns the value of the attribute interpreted as an integer. The default value will be returned if the attribute isn't present, or if there is an error. (For a method with error checking, see [QueryIntAttribute\(\)](#)).

7.17.3.29 QueryAttribute() [5/8]

```
XMLError tinyxml2::XMLElement::QueryAttribute (
    const char * name,
    int * value) const [inline]
```

Given an attribute name, [QueryAttribute\(\)](#) returns XML_SUCCESS, XML_WRONG_ATTRIBUTE_TYPE if the conversion can't be performed, or XML_NO_ATTRIBUTE if the attribute doesn't exist. It is overloaded for the primitive types, and is a generally more convenient replacement of [QueryIntAttribute\(\)](#) and related functions.

If successful, the result of the conversion will be written to 'value'. If not successful, nothing will be written to 'value'. This allows you to provide default value:

```
int value = 10;
QueryAttribute( "foo", &value );           // if "foo" isn't found, value will still be 10
```

7.17.3.42 QueryIntText()

```
XML_Error tinyxml2::XMLElement::QueryIntText (
    int * ival) const
```

Convenience method to query the value of a child text node. This is probably best shown by example. Given you have a document is this form:

```
<point>
  <x>1</x>
  <y>1.4</y>
</point>
```

The [QueryIntText\(\)](#) and similar functions provide a safe and easier way to get to the "value" of x and y.

```
int x = 0;
float y = 0;    // types of x and y are contrived for example
const XML_Element* xElement = pointElement->FirstChildElement( "x" );
const XML_Element* yElement = pointElement->FirstChildElement( "y" );
xElement->QueryIntText( &x );
yElement->QueryFloatText( &y );
```

Returns

XML_SUCCESS (0) on success, XML_CAN_NOT_CONVERT_TEXT if the text cannot be converted to the requested type, and XML_NO_TEXT_NODE if there is no child text to query.

7.17.3.58 SetText() [2/8]

```
void tinyxml2::XMLElement::SetText (
    const char * inText)
```

Convenience function for easy access to the text inside an element. Although easy and concise, [SetText\(\)](#) is limited compared to creating an [XMLText](#) child and mutating it directly.

If the first child of 'this' is a [XMLText](#), [SetText\(\)](#) sets its value to the given string, otherwise it will create a first child that is an [XMLText](#).

This is a convenient method for setting the text of simple contained text:

```
<foo>This is text</foo>
fooElement->SetText( "Hullaballoo!" );
<foo>Hullaballoo!</foo>
```

Note that this function can be misleading. If the element foo was created from this XML:

```
<foo><b>This is text</b></foo>
```

then it will not change "This is text", but rather prefix it with a text element:

```
<foo>Hullaballoo!<b>This is text</b></foo>
```

For this XML:

```
<foo />
```

[SetText\(\)](#) will generate

```
<foo>Hullaballoo!</foo>
```

7.18.1 Detailed Description

A [XMLHandle](#) is a class that wraps a node pointer with null checks; this is an incredibly useful thing. Note that [XMLHandle](#) is not part of the TinyXML-2 DOM structure. It is a separate utility class.

Take an example:

```
<Document>
  <Element attributeA = "valueA">
    <Child attributeB = "value1" />
    <Child attributeB = "value2" />
  </Element>
</Document>
```

Assuming you want the value of "attributeB" in the 2nd "Child" element, it's very easy to write a *lot* of code that looks like:

```
XMLElement* root = document.FirstChildElement( "Document" );
if ( root )
{
    XMLElement* element = root->FirstChildElement( "Element" );
    if ( element )
    {
        XMLElement* child = element->FirstChildElement( "Child" );
        if ( child )
        {
            XMLElement* child2 = child->NextSiblingElement( "Child" );
            if ( child2 )
            {
                // Finally do something useful.
            }
        }
    }
}
```

And that doesn't even cover "else" cases. [XMLHandle](#) addresses the verbosity of such code. A [XMLHandle](#) checks for null pointers so it is perfectly safe and correct to use:

```
XMLHandle docHandle( &document );
XMLElement* child2 = docHandle.FirstChildElement( "Document" ).FirstChildElement( "Element" ).FirstChildElement( "Child" );
if ( child2 )
{
    // do something useful
}
```

Which is MUCH more concise and useful.

It is also safe to copy handles - internally they are nothing more than node pointers.

```
XMLHandle handleCopy = handle;
```

See also [XMLConstHandle](#), which is the same as [XMLHandle](#), but operates on const objects.

7.19.1 Detailed Description

[XMLNode](#) is a base class for every object that is in the XML Document Object [Model](#) (DOM), except [XMLAttributes](#). Nodes have siblings, a parent, and children which can be navigated. A node is always in a [XMLDocument](#). The type of a [XMLNode](#) can be queried, and it can be cast to its more defined type.

A [XMLDocument](#) allocates memory for all its Nodes. When the [XMLDocument](#) gets deleted, all its Nodes will also be deleted.

```
A Document can contain: Element (container or leaf)
                        Comment (leaf)
                        Unknown (leaf)
                        Declaration( leaf )
```

```
An Element can contain: Element (container or leaf)
                        Text (leaf)
                        Attributes (not on tree)
                        Comment (leaf)

7.19.3.1 Accept()

```
virtual bool tinyxml2::XMLNode::Accept (
    XMLVisitor * visitor) const [pure virtual]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implemented in [tinyxml2::XMLComment](#), [tinyxml2::XMLDeclaration](#), [tinyxml2::XMLDocument](#), [tinyxml2::XMLElement](#), [tinyxml2::XMLText](#), and [tinyxml2::XMLUnknown](#).

Definition at line 821 of file [tinyxml2.cpp](#).

7.19.3.4 DeepClone()

```
XMLNode * tinyxml2::XMLNode::DeepClone (
    XMLDocument * target) const
```

Make a copy of this node and all its children.

If the 'target' is null, then the nodes will be allocated in the current document. If 'target' is specified, the memory will be allocated in the specified [XMLDocument](#).

NOTE: This is probably not the correct tool to copy a document, since XMLDocuments can have multiple top level XMLNodes. You probably want to use [XMLDocument::DeepCopy\(\)](#)

7.19.3.15 InsertAfterChild()

```
XMLNode * tinyxml2::XMLNode::InsertAfterChild (
    XMLNode * afterThis,
    XMLNode * addThis)
```

Add a node after the specified child node. If the child node is already part of the document, it is moved from its old location to the new location. Returns the addThis argument or 0 if the afterThis node is not a child of this node, or if the node does not belong to the same document.

Definition at line 986 of file [tinyxml2.cpp](#).

7.19.3.16 InsertEndChild()

```
XMLNode * tinyxml2::XMLNode::InsertEndChild (
    XMLNode * addThis)
```

Add a child node as the last (right) child. If the child node is already part of the document, it is moved from its old location to the new location. Returns the addThis argument or 0 if the node does not belong to the same document.

Definition at line 925 of file [tinyxml2.cpp](#).

7.19.3.17 InsertFirstChild()

```
XMLNode * tinyxml2::XMLNode::InsertFirstChild (
    XMLNode * addThis)
```

Add a child node as the first (left) child. If the child node is already part of the document, it is moved from its old location to the new location. Returns the addThis argument or 0 if the node does not belong to the same document.

Definition at line 955 of file [tinyxml2.cpp](#).

7.19.3.18 LastChild() [1/2]

```
XMLNode * tinyxml2::XMLNode::LastChild () [inline]
```

Definition at line 793 of file [tinyxml2.h](#).

7.19.3.19 LastChild() [2/2]

```
const XMLNode * tinyxml2::XMLNode::LastChild () const [inline]
```

Get the last child node, or null if none exists.

Definition at line 789 of file [tinyxml2.h](#).

Get the previous (left) sibling element of this node, with an optionally supplied name.

Definition at line 1060 of file [tinyxml2.cpp](#).

7.19.3.35 SetUserData()

```
void tinyxml2::XMLNode::SetUserData (
    void * userData) [inline]
```

Set user data into the [XMLNode](#). TinyXML-2 in no way processes or interprets user data. It is initially 0.

Definition at line 941 of file [tinyxml2.h](#).

7.19.3.36 SetValue()

```
void tinyxml2::XMLNode::SetValue (
    const char * val,
    bool staticMem = false)
```

Set the Value of an XML node.

7.19.3.37 ShallowClone()

```
virtual XMLNode * tinyxml2::XMLNode::ShallowClone (
    XMLDocument * document) const [pure virtual]
```

Make a copy of this node, but not its children. You may pass in a Document pointer that will be the owner of the new Node. If the 'document' is null, then the node returned will be allocated from the current Document. (this->[GetDocument\(\)](#))

Note: if called on a [XMLDocument](#), this will return null.

Implemented in [tinyxml2::XMLComment](#), [tinyxml2::XMLDeclaration](#), [tinyxml2::XMLDocument](#), [tinyxml2::XMLElement](#), [tinyxml2::XMLText](#), and [tinyxml2::XMLUnknown](#).

7.19.3.38 ShallowEqual()

```
virtual bool tinyxml2::XMLNode::ShallowEqual (
    const XMLNode * compare) const [pure virtual]
```

Test if 2 nodes are the same, but don't test children. The 2 nodes do not need to be in the same Document.

Note: if called on a [XMLDocument](#), this will return false.

Implemented in [tinyxml2::XMLComment](#), [tinyxml2::XMLDeclaration](#), [tinyxml2::XMLDocument](#), [tinyxml2::XMLElement](#), [tinyxml2::XMLText](#), and [tinyxml2::XMLUnknown](#).

7.19.3.39 ToComment() [1/2]

7.20.1 Detailed Description

Printing functionality. The `XMLPrinter` gives you more options than the `XMLDocument::Print()` method. It can:

1. Print to memory.
2. Print to a file you provide.
3. Print XML without a `XMLDocument`.

Print to Memory

```
XMLPrinter printer;
doc.Print( &printer );
SomeFunction( printer.CStr() );
```

Print to a File

You provide the file pointer.

```
XMLPrinter printer( fp );
doc.Print( &printer );
```

Print without a `XMLDocument`

When loading, an XML parser is very useful. However, sometimes when saving, it just gets in the way. The code is often set up for streaming, and constructing the DOM is just overhead.

The Printer supports the streaming case. The following code prints out a trivially simple XML file without ever creating an XML document.

```
XMLPrinter printer( fp );
printer.OpenElement( "foo" );
printer.PushAttribute( "foo", "bar" );
printer.CloseElement();
```

Definition at line 2240 of file `tinyxml2.h`.

7.20.2 Constructor & Destructor Documentation

7.20.2.1 XMLPrinter()

```
tinyxml2::XMLPrinter::XMLPrinter (
    FILE * file = 0,
    bool compact = false,
    int depth = 0)
```

Construct the printer. If the `FILE*` is specified, this will print to the `FILE`. Else it will print to memory, and the result is available in `CStr()`. If 'compact' is set to true, then output is created with only required whitespace and newlines.

Definition at line 2580 of file `tinyxml2.cpp`.

7.20.2.2 ~XMLPrinter()

```
virtual tinyxml2::XMLPrinter::~~XMLPrinter () [inline], [virtual]
```

Definition at line 2250 of file `tinyxml2.h`.

7.20.3 Member Function Documentation

7.20.3.1 ClearBuffer()

```
void tinyxml2::XMLPrinter::ClearBuffer (
    bool resetToFirstElement = true) [inline]
```

If in print to memory mode, reset the buffer to the beginning.

Definition at line 2324 of file `tinyxml2.h`.

7.20.3.2 CloseElement()

```
void tinyxml2::XMLPrinter::CloseElement (
    bool compactMode = false) [virtual]
```

If streaming, close the Element.

Definition at line 2820 of file [tinyxml2.cpp](#).

7.20.3.3 CompactMode()

```
virtual bool tinyxml2::XMLPrinter::CompactMode (
    const XMLElement & ) [inline], [protected], [virtual]
```

Definition at line 2331 of file [tinyxml2.h](#).

7.20.3.4 CStr()

```
const char * tinyxml2::XMLPrinter::CStr () const [inline]
```

If in print to memory mode, return a pointer to the XML file in memory.

Definition at line 2309 of file [tinyxml2.h](#).

7.20.3.5 CStrSize()

```
size_t tinyxml2::XMLPrinter::CStrSize () const [inline]
```

If in print to memory mode, return the size of the XML file in memory. (Note the size returned includes the terminating null.)

Definition at line 2317 of file [tinyxml2.h](#).

7.20.3.6 OpenElement()

```
void tinyxml2::XMLPrinter::OpenElement (
    const char * name,
    bool compactMode = false)
```

If streaming, start writing an element. The element must be closed with [CloseElement\(\)](#)

Definition at line 2748 of file [tinyxml2.cpp](#).

7.20.3.7 Print()

```
void tinyxml2::XMLPrinter::Print (
    const char * format,
    ...) [protected], [virtual]
```

Definition at line 2608 of file [tinyxml2.cpp](#).

7.20.3.8 PrintSpace()

```
void tinyxml2::XMLPrinter::PrintSpace (
    int depth) [protected], [virtual]
```

Prints out the space before an element. You may override to change the space and tabs used. A [PrintSpace\(\)](#) override should call [Print\(\)](#).

Definition at line 2656 of file [tinyxml2.cpp](#).

7.20.3.9 PushAttribute() [1/7]

```
void tinyxml2::XMLPrinter::PushAttribute (
    const char * name,

```

Definition at line 2804 of file [tinyxml2.cpp](#).

7.20.3.10 PushAttribute() [2/7]

```
void tinyxml2::XMLPrinter::PushAttribute (
    const char * name,
    const char * value)
```

If streaming, add an attribute to an open element.

Definition at line 2761 of file [tinyxml2.cpp](#).

7.20.3.11 PushAttribute() [3/7]

```
void tinyxml2::XMLPrinter::PushAttribute (

void tinyxml2::XMLPrinter::PushAttribute (
    const char * name,
    unsigned value)
```

Definition at line 2780 of file [tinyxml2.cpp](#).

7.20.3.16 PushComment()

```
void tinyxml2::XMLPrinter::PushComment (
    const char * comment)
```

Add a comment.

Definition at line 2930 of file [tinyxml2.cpp](#).

7.20.3.17 PushDeclaration()

```
void tinyxml2::XMLPrinter::PushDeclaration (
    const char * value)
```

Definition at line 2940 of file [tinyxml2.cpp](#).

7.20.3.18 PushHeader()

```
void tinyxml2::XMLPrinter::PushHeader (

7.21.1 Detailed Description

XML text.

Note that a text node can have child element nodes, for example:

```
<root>This is <b>bold</b></root>
```

A text node can have 2 ways to output the next. "normal" output and CDATA. It will default to the mode it was parsed from the XML file and you generally want to leave it alone, but you can change the output mode with [SetCDATA\(\)](#) and query it with [CDATA\(\)](#).

7.21.3 Member Function Documentation

7.21.3.1 Accept()

```
bool tinyxml2::XMLText::Accept (
    XMLVisitor * visitor) const [override], [virtual]
```

Accept a hierarchical visit of the nodes in the TinyXML-2 DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [XMLVisitor](#) interface.

This is essentially a SAX interface for TinyXML-2. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML-2 is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
XMLPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implements [tinyxml2::XMLNode](#).

Definition at line 1279 of file [tinyxml2.cpp](#).

7.21.3.2 CData()

```
bool tinyxml2::XMLText::CData () const [inline]
```

Returns true if this is a CDATA text element.

Definition at line 1011 of file [tinyxml2.h](#).

7.21.3.3 ParseDeep()

```
char * tinyxml2::XMLText::ParseDeep (
    char * p,
    StrPair * parentEndTag,
    int * curLineNumPtr) [override], [protected], [virtual]
```

Definition at line 1233 of file [tinyxml2.cpp](#).

7.21.3.4 SetCData()

```
void tinyxml2::XMLText::SetCData (
    bool isCData) [inline]
```

Declare whether this should be CDATA or standard text.

Definition at line 1007 of file [tinyxml2.h](#).

7.21.3.5 ShallowClone()

```
XMLNode * tinyxml2::XMLText::ShallowClone (
    XMLDocument * document) const [override], [virtual]
```

Make a copy of this node, but not its children. You may pass in a Document pointer that will be the owner of the new Node. If the 'document' is null, then the node returned will be allocated from the current Document. (this->[GetDocument\(\)](#))

Note: if called on a [XMLDocument](#), this will return null.

Implements [tinyxml2::XMLNode](#).

Definition at line 1260 of file [tinyxml2.cpp](#).

7.21.3.6 ShallowEqual()

```
bool tinyxml2::XMLText::ShallowEqual (
    const XMLNode * compare) const [override], [virtual]
```

Test if 2 nodes are the same, but don't test children. The 2 nodes do not need to be in the same Document.

Note: if called on a [XMLDocument](#), this will return false.

Implements [tinyxml2::XMLNode](#).

Definition at line 1271 of file [tinyxml2.cpp](#).

7.21.3.7 ToText() [1/2]

7.22.1 Detailed Description

Any tag that TinyXML-2 doesn't recognize is saved as an unknown. It is a tag of text, but should not be modified. It will be written back to the XML, unchanged, when the file is saved.

DTD tags get thrown into XMLUnknowns.

Public Member Functions

- virtual `~XMLVisitor()`
- virtual bool `VisitEnter` (const `XMLDocument` &)
Visit a document.
- virtual bool `VisitExit` (const `XMLDocument` &)
Visit a document.
- virtual bool `VisitEnter` (const `XMLElement` &, const `XMLAttribute` *)
Visit an element.
- virtual bool `VisitExit` (const `XMLElement` &)
Visit an element.
- virtual bool `Visit` (const `XMLDeclaration` &)
Visit a declaration.
- virtual bool `Visit` (const `XMLText` &)
Visit a text node.
- virtual bool `Visit` (const `XMLComment` &)
Visit a comment node.
- virtual bool `Visit` (const `XMLUnknown` &)
Visit an unknown node.

7.24.1 Detailed Description

Implements the interface to the "Visitor pattern" (see the `Accept()` method.) If you call the `Accept()` method, it requires being passed a `XMLVisitor` class to handle callbacks. For nodes that contain other nodes (Document, Element) you will get called with a `VisitEnter/VisitExit` pair. Nodes that are always leaves are simply called with `Visit()`. If you return 'true' from a Visit method, recursive parsing will continue. If you return false, **no children of this node or its siblings** will be visited.

All flavors of Visit methods have a default implementation that returns 'true' (continue visiting). You need to only override methods that are interesting to you.

Generally `Accept()` is called on the `XMLDocument`, although all nodes support visiting.

You should never change the document from a callback.

8.15.1 Detailed Description

Main rendering engine for 3D graphics application.

This file implements the core rendering engine that processes 3D models defined in XML configuration files, and renders them using OpenGL.

Definition in file [engine.cpp](#).

8.15.2 Macro Definition Documentation

8.15.2.1 GL_SILENCE_DEPRECATION

```
#define GL_SILENCE_DEPRECATION
```

Definition at line 10 of file [engine.cpp](#).

8.15.3 Function Documentation

8.15.3.1 changeSize()

```
void changeSize (
    int w,
    int h)
```

[Window](#) resize callback function.

Handles viewport and projection matrix updates when the window is resized. Maintains the correct aspect ratio for the perspective projection.

Parameters

| | |
|----------|----------------------------|
| <i>w</i> | New window width in pixels |
|----------|----------------------------|

Parameters

| | |
|----------|-----------------------------|
| <i>h</i> | New window height in pixels |
|----------|-----------------------------|

Definition at line 106 of file [engine.cpp](#).

8.15.3.2 loadModel()

```
void loadModel (
    Model & model)
```

Loads a 3D model from a file into memory.

Reads vertex data from the specified file and stores it in the model's vertices vector. Each vertex consists of x, y, z coordinates.

Parameters

| | |
|--------------|--|
| <i>model</i> | Reference to the Model object to populate with vertex data |
|--------------|--|

Definition at line 45 of file [engine.cpp](#).

8.15.3.3 main()

```
int main (
    int argc,
    char ** argv)
```

Main function - program entry point.

Initializes GLUT, loads XML configuration and model data, sets up rendering parameters, and starts the main rendering loop.

Parameters

| | |
|-------------|------------------------------|
| <i>argc</i> | Command line argument count |
| <i>argv</i> | Command line argument values |

Returns

0 on successful execution, 1 on error

Definition at line 135 of file [engine.cpp](#).

8.15.3.4 renderScene()

```
void renderScene ()
```

Main rendering function called by GLUT for each frame.

Clears the screen, sets up the camera view based on world configuration, and renders all models in wireframe mode using GL_TRIANGLES.

Definition at line 64 of file [engine.cpp](#).

8.15.4 Variable Documentation**8.15.4.1 world**

```
World world
```

Global world state containing all scene information.

This includes models, camera configuration, and window settings loaded from the XML configuration file.

Functions

- [World parseXMLFile](#) (const char *filename)
Parses an XML configuration file and constructs a [World](#) object.

8.19.1 Detailed Description

XML configuration parser for 3D graphics engine.

This file implements functionality to parse XML configuration files that define camera settings, window dimensions, and 3D model references for the rendering engine.

Definition in file [xmlParser.cpp](#).

8.19.2 Function Documentation

8.19.2.1 parseXMLFile()

```

World parseXMLFile (
    const char * filename)

```

Parses an XML configuration file and constructs a [World](#) object.

This function reads an XML file that defines:

- [Window](#) dimensions (width and height)
- [Camera](#) parameters (position, lookAt point, up vector, projection settings)
- 3D models to be rendered

XML structure expected: <world> <window width="X" height="Y" > <camera> <position x="X" y="Y" z="Z" > <lookAt x="X" y="Y" z="Z" > <up x="X" y="Y" z="Z" > <projection fov="F" near="N" far="F" > </camera> </group> <models> <model file="filename.3d" > ... </models> </group> </world>

Parameters

| | |
|-----------------|------------------------------------|
| <i>filename</i> | Path to the XML configuration file |
|-----------------|------------------------------------|

Returns

[World](#) object containing parsed configuration data

Parse window settings

Example: <window width="512" height="512" >

Extracts width and height attributes to define the window dimensions.

Parse camera settings

Example: <camera> <position x="5" y="-2" z="3" > <lookAt x="0" y="0" z="0" > <up x="0" y="1" z="0" > <projection fov="60" near="1" far="1000" > </camera>

Extracts camera position, lookAt point, up vector, and projection parameters.

Parse 3D model references

Example: <group> <models> <model file="cone_1_2_4_3.3d" > </models> </group>

Extracts model filenames and constructs paths to the 3D model files.

Functions

- [World parseXMLFile](#) (const char *filename)
Parses an XML configuration file and constructs a [World](#) object.

8.21.1 Function Documentation

8.21.1.1 parseXMLFile()

```
World parseXMLFile (
    const char * filename)
```

Parses an XML configuration file and constructs a [World](#) object.

This function reads an XML file that defines:

- [Window](#) dimensions (width and height)
- [Camera](#) parameters (position, lookAt point, up vector, projection settings)
- 3D models to be rendered

XML structure expected: <world> <window width="X" height="Y" > <camera> <position x="X" y="Y" z="Z" > <lookAt x="X" y="Y" z="Z" > <up x="X" y="Y" z="Z" > <projection fov="F" near="N" far="F" > </camera> </group> <models> <model file="filename.3d" > ... </models> </group> </world>

Parameters

| | |
|-----------------|------------------------------------|
| <i>filename</i> | Path to the XML configuration file |
|-----------------|------------------------------------|

Returns

[World](#) object containing parsed configuration data

Parse window settings

Example: <window width="512" height="512" >

Extracts width and height attributes to define the window dimensions.

Parse camera settings

Example: <camera> <position x="5" y="-2" z="3" > <lookAt x="0" y="0" z="0" > <up x="0" y="1" z="0" > <projection fov="60" near="1" far="1000" > </camera>

Extracts camera position, lookAt point, up vector, and projection parameters.

Parse 3D model references

Example: <group> <models> <model file="cone_1_2_4_3.3d" > </models> </group>

Extracts model filenames and constructs paths to the 3D model files.

8.27.1 Detailed Description

3D primitive shape generator implementation

This file implements a command-line application for generating 3D primitive shapes (plane, box, cone, sphere) and saving them to .3d files for use in the rendering engine. Each primitive can be customized with different parameters to control its dimensions and complexity.

Definition in file [generator.cpp](#).

8.27.2 Function Documentation

8.27.2.1 [handleBox\(\)](#)

```

void handleBox (
    int argc,
    char ** argv)

```

Handles the generation of a box primitive.

Creates a box centered at the origin with specified dimensions and complexity. Each face of the box is divided according to the slices parameter.

Parameters

| | |
|-------------|---|
| <i>argc</i> | The total number of command line arguments |
| <i>argv</i> | The array of command line arguments <i>argv</i> [2]: unit - The half-length of the box sides <i>argv</i> [3]: slices - The number of divisions along each axis of each face <i>argv</i> [4]: output filename (ignored; standardized name is used) |

Exceptions

| | |
|------------------------------|---|
| <i>std::invalid_argument</i> | If the required parameters are missing or invalid |
|------------------------------|---|

Definition at line 73 of file [generator.cpp](#).

8.27.2.2 handleCone()

```
void handleCone (
    int argc,
    char ** argv)
```

Handles the generation of a cone primitive.

Creates a cone with its base centered at the origin and apex along the positive Y axis. The cone's complexity is controlled by slices (around the circular base) and stacks (along height).

Parameters

| | |
|-------------|--|
| <i>argc</i> | The total number of command line arguments |
| <i>argv</i> | The array of command line arguments <i>argv</i> [2]: radius - The radius of the cone base <i>argv</i> [3]: height - The height of the cone <i>argv</i> [4]: slices - The number of divisions around the circular base <i>argv</i> [5]: stacks - The number of divisions along the height <i>argv</i> [6]: output filename (ignored; standardized name is used) |

Exceptions

| | |
|------------------------------|---|
| <i>std::invalid_argument</i> | If the required parameters are missing or invalid |
|------------------------------|---|

Definition at line 100 of file [generator.cpp](#).

8.27.2.3 handlePlane()

```
void handlePlane (
    int argc,
    char ** argv)
```

Handles the generation of a plane primitive.

Creates a plane centered at the origin with specified dimensions and complexity. The plane is constructed in the XZ plane (with Y as up axis).

Parameters

| | |
|-------------|--|
| <i>argc</i> | The total number of command line arguments |
| <i>argv</i> | The array of command line arguments <i>argv</i> [2]: unit - The half-length of the plane sides <i>argv</i> [3]: slices - The number of divisions along each axis <i>argv</i> [4]: output filename (ignored; standardized name is used) |

Exceptions

| | |
|------------------------------|---|
| <i>std::invalid_argument</i> | If the required parameters are missing or invalid |
|------------------------------|---|

Definition at line 48 of file [generator.cpp](#).

8.27.2.4 handleSphere()

```
void handleSphere (
    int argc,
    char ** argv)
```

Handles the generation of a sphere primitive.

Creates a sphere centered at the origin with specified radius and complexity. The sphere's complexity is controlled by slices (longitude) and stacks (latitude).

Parameters

| | |
|-------------|--|
| <i>argc</i> | The total number of command line arguments |
| <i>argv</i> | The array of command line arguments <i>argv</i> [2]: radius - The radius of the sphere <i>argv</i> [3]: slices - The number of divisions along the longitude (around vertical axis) <i>argv</i> [4]: stacks - The number of divisions along the latitude (from pole to pole) <i>argv</i> [5]: output filename (ignored; standardized name is used) |

Exceptions

| | |
|------------------------------|---|
| <i>std::invalid_argument</i> | If the required parameters are missing or invalid |
|------------------------------|---|

Definition at line 132 of file [generator.cpp](#).

8.27.2.5 main()

```
int main (
    int argc,
    char ** argv)
```

Main function - program entry point.

Parses command-line arguments and dispatches to the appropriate shape handler function. Uses a map to associate primitive names with their handler functions for extensibility.

Parameters

| | |
|-------------|--|
| <i>argc</i> | The total number of command line arguments |
| <i>argv</i> | The array of command line arguments <i>argv</i> [0]: program name <i>argv</i> [1]: shape type (plane, box, cone, sphere) <i>argv</i> [2+]: shape-specific parameters |

Returns

0 on successful execution, 1 on error

Definition at line 158 of file [generator.cpp](#).

8.27.2.6 showUsage()

```
void showUsage (
    const std::string & programName)
```

Displays usage instructions for the generator program.

Outputs a help message showing the available shapes, their required parameters, and example usage to guide users in correctly invoking the program.

Parameters

| | |
|--------------------|---|
| <i>programName</i> | The name of the executable (<i>argv</i> [0]) |
|--------------------|---|

```

void cone (
    float radius,

```

```

float height,
int slices,
int stacks,
const std::string & filename)

```

Generates vertices for a cone with a circular base and a pointed apex.

Parameters

| | |
|-----------------|---|
| <i>radius</i> | The radius of the base of the cone. |
| <i>height</i> | The height of the cone. |
| <i>slices</i> | The number of divisions around the circumference. |
| <i>stacks</i> | The number of divisions along the height. |
| <i>filename</i> | The name of the file to save the vertices. |

8.31.1 Function Documentation

8.31.1.1 [box\(\)](#)

```
void box (
    float unit,
    int slices,
    const std::string & filename)
```

Definition at line 68 of file [generatorAux.cpp](#).

8.31.1.2 [cone\(\)](#)

```
void cone (
    float radius,
    float height,
    int slices,
    int stacks,
    const std::string & filename)
```

Generates vertices for a cone with a circular base and a pointed apex.

Parameters

| | |
|-----------------|---|
| <i>radius</i> | The radius of the base of the cone. |
| <i>height</i> | The height of the cone. |
| <i>slices</i> | The number of divisions around the circumference. |
| <i>stacks</i> | The number of divisions along the height. |
| <i>filename</i> | The name of the file to save the vertices. |

Exceptions

| | |
|------------------------------|--|
| <i>std::invalid_argument</i> | If radius, height, slices, or stacks are non-positive. |
|------------------------------|--|

Definition at line 209 of file [generatorAux.cpp](#).

8.31.1.3 [plane\(\)](#)

```
void plane (
    float unit,
```

```
    int slices,  
    const std::string & filename)
```

Generates vertices for a plane in the XZ plane, centered at the origin.

Parameters

| | |
|-----------------|--|
| <i>unit</i> | The size of the plane (length of each side). |
| <i>slices</i> | The number of divisions along each axis. |
| <i>filename</i> | The name of the file to save the vertices. |

Exceptions

| | |
|------------------------------|-------------------------------------|
| <i>std::invalid_argument</i> | If unit or slices are non-positive. |
|------------------------------|-------------------------------------|

8.31.1.4 sphere()

```
void sphere (
    float radius,
    int slices,
    int stacks,
    const std::string & filename)
```

Generates vertices for a sphere using spherical coordinates.

Parameters

| | |
|-----------------|---|
| <i>radius</i> | The radius of the sphere. |
| <i>slices</i> | The number of divisions around the equator. |
| <i>stacks</i> | The number of divisions from pole to pole. |
| <i>filename</i> | The name of the file to save the vertices. |

Exceptions

| | |
|------------------------------|--|
| <i>std::invalid_argument</i> | If radius, slices, or stacks are non-positive. |
|------------------------------|--|

Definition at line 277 of file [generatorAux.cpp](#).

8.31.1.5 writeVertices()

```
void writeVertices (
    const std::string & filename,
    const std::vector< Vertex > & vertices)
```

Writes a list of vertices to a file. The first line of the file contains the number of vertices, followed by the coordinates of each vertex.

Parameters

| | |
|-----------------|--|
| <i>filename</i> | The name of the file to write the vertices to. |
| <i>vertices</i> | The list of vertices to write. |

Exceptions

| | |
|---------------------------|-------------------------------|
| <i>std::runtime_error</i> | If the file cannot be opened. |
|---------------------------|-------------------------------|
